Amendments to the Claims:

This listing of claims replaces all prior versions and listings of claims in the application:

Listing of Claims:

1-11. (Cancelled)

12. (New) An immunoassay method for determining the concentration of dioxins in a sample, the method comprising the following steps:

1) allowing target dioxins in a sample and

a competitive antigen

to competitively react with a primary anti-dioxin antibody capable of binding to the target dioxins, and

determining the amount of competitive antigen-antibody complex from a label incorporated into a secondary antibody binding to the primary antibody,

2) allowing the competitive antigen and

a compound of formula (1) of known concentration

wherein R^1, R^2, R^3 and R^4 may be the same or different and each represents chlorine or hydrogen, n is an integer from 1 to 10, and Z is an amino acid residue or peptide

to competitively react with the primary anti-dioxin antibody, and

determining the amount of competitive antigen-antibody complex from a label incorporated into a secondary antibody binding to the primary antibody;

3) preparing a calibration curve using the amount of competitive antigen-antibody complex determined in step 2); and

4) comparing the amount of competitive antigen-antibody complex determined in step 1) with the calibration curve prepared in step 3).

13. (New) The immunoassay method according to claim 12, wherein the competitive antigen is a compound of formula (1) wherein Z is a carrier protein.

14. (New) The immunoassay method according to claim 12, wherein the label is an enzyme, a radioactive substance, or a fluorescent substance.

15. (New) The immunoassay method according to claim 12, wherein in formula (1), R^2 and R^4 are chlorine, R^1 and R^3 are hydrogen, n is 5, and Z represents 1 to 3 amino acid residues.

16. (New) The immunoassay method according to claim 12, wherein in formula (1), R^2 and R^3 are chlorine, R^1 and R^4 are hydrogen, n is 2, and Z represents 1 to 3 amino acid residues.
17. (New) An immunoassay method for determining the concentration of dioxins in a sample, the method comprising the following steps:

1) allowing target dioxins in a sample and

a labeled competitive antigen

to competitively react with a primary anti-dioxin antibody capable of binding to the target dioxins, and

determining the amount of competitive antigen-antibody complex from a label incorporated into the competitive antigen;

2) allowing the competitive antigen and

a compound of formula (1) of known concentration

$$
\text{Cl} \quad \overset{R^1}{\underset{R^4 \quad R^3}{\bigcirc}} \overset{R^2}{\underset{O-(CH_2)nCONH\text{-}Z}{}}
$$

(1)

wherein R^1, R^2, R^3 and R^4 may be the same or different and each represents chlorine or hydrogen, n is an integer from 1 to 10, and Z is an amino acid residue or peptide

to competitively react with the primary anti-dioxin antibody, and

determining the amount of competitive antigen-antibody complex from a label incorporated into the competitive antigen;

3) preparing a.calibration curve using the amount of competitive antigen-antibody complex determined in step 2); and

4) comparing the amount of competitive antigen-antibody complex determined in step 1) with the calibration curve prepared in step 3).

18. (New) The immunoassay method according to claim 17, wherein the competitive antigen is a compound of formula (1) wherein Z is a carrier protein.
19. (New) The immunoassay method according to claim 17, wherein the label is an enzyme, a radioactive substance or a fluorescent substance.

20. (New) The immunoassay method according to claim 17, wherein in formula (1), R^2 and R^4 are chlorine, R^1 and R^3 are hydrogen, n is 5, and Z represents 1 to 3 amino acid residues.

21. (New) The immunoassay method according to claim 17, wherein in formula (1), R^2 and R^3 are chlorine, R^1 and R^4 are hydrogen, n is 2, and Z represents 1 to 3 amino acid residues.

22. (New) A method of evaluating the toxic equivalent (TEQ) of dioxins in a sample, the method comprising the following steps:

1) allowing target dioxins in a sample and

a competitive antigen

to competitively react with a primary anti-dioxin antibody capable of binding to the target dioxins, and

determining the amount of competitive antigen-antibody complex from a label incorporated into a secondary antibody binding to the primary antibody,

2) allowing the competitive antigen and

a compound of formula (1) of known concentration

$$\text{Cl} \overset{R^1}{\underset{R^3}{\underset{R^4}{\bigcirc}}} R^2 \quad O-(CH_2)nCONH\text{-}Z \qquad (1)$$

wherein R^1, R^2, R^3 and R^4 may be the same or different and each represents chlorine or hydrogen, n is an integer from 1 to 10, and Z is an amino acid residue or peptide

to competitively react with the primary anti-dioxin antibody, and

determining the amount of competitive antigen-antibody complex from a label incorporated into a secondary antibody binding to the primary antibody;

3) preparing a calibration curve using the amount of competitive antigen-antibody complex determined in step 2);

4) comparing the amount of competitive antigen-antibody complex determined in step 1) with the calibration curve prepared in step 3); and

5) calculating the TEQ of dioxins in a sample.

23. (New) The method according to claim 22, wherein the competitive antigen is a compound of formula (1) wherein Z is a carrier protein.

24. (New) The method according to claim 22, wherein the label is an enzyme, a radioactive substance or a fluorescent substance.

25. (New) The method according to claim 22, wherein in formula (1), R^2 and R^4 are chlorine, R^1 and R^3 are hydrogen, n is 5, and Z represents 1 to 3 amino acid residues.
26. (New) The method according to claim 22, wherein in formula (1), R^2 and R^3 are chlorine, R^1 and R^4 are hydrogen, n is 2, and Z represents 1 to 3 amino acid residues.

27. (New) A method of evaluating the toxic equivalent (TEQ) of dioxins in a sample, the method comprising the following steps:

1) allowing target dioxins in a sample and

a labeled competitive antigen

to competitively react with a primary anti-dioxin antibody capable of binding to the target dioxins, and

determining the amount of competitive antigen-antibody complex from a label incorporated into the competitive antigen;

2) allowing the competitive antigen and

a compound of formula (1) of known concentration

(1)

wherein R^1, R^2, R^3 and R^4 may be the same or different and each represents chlorine or

hydrogen, n is an integer from 1 to 10, and Z is an amino acid residue or peptide

to competitively react with the primary anti-dioxin antibody, and

determining the amount of competitive antigen-antibody complex from a label

incorporated into the competitive antigen;

3) preparing a calibration curve using the amount of competitive antigen-antibody

complex determined in step 2);

4) comparing the amount of competitive antigen-antibody complex determined in step

1) with the calibration curve prepared in step 3); and

5) calculating the TEQ of dioxins in a sample.

28. (New) The method according to claim 27, wherein the competitive antigen is a

compound of formula (1) wherein Z is a carrier protein.

29. (New) The method according to claim 27, wherein the label is an enzyme, a

radioactive substance or a fluorescent substance.

30. (New) The method according to claim 27, wherein in formula (1), R^2 and R^4 are

chlorine, R^1 and R^3 are hydrogen, n is 5, and Z represents 1 to 3 amino acid residues.

31. (New) The method according to claim 27, wherein in formula (1), R^2 and R^3 are

chlorine, R^1 and R^4 are hydrogen, n is 2, and Z represents 1 to 3 amino acid residues.
